

PDF Merger + Watermark

As a software developer, I am excited to share my latest creation with you - a PDF combiner tool that is designed to make your life easier. With this tool, you can combine multiple PDF files into a single, large PDF file and add a watermark with just a few clicks.

One of the best features of this PDF combiner tool is its ability to combine as many PDF files as you want. Whether you have two PDF files or twenty, you can easily combine them all into one big PDF file. This saves you the hassle of having to open and edit each file individually, which can be time-consuming and tedious.

Another great feature of this tool is its ability to add a watermark to your PDF files. With just a few clicks, you can add your watermark to every page of the combined PDF to help protect your content or add branding. This feature is particularly useful for businesses or individuals who need to share PDF files that contain confidential information or sensitive data.

Using the PDF combiner tool is simple and straightforward. You just need to path the PDF files names that you want to combine after the "python3 main.py" command. The tool will then merge all the PDF files into one large file. If you want to add a watermark, you'll need to specify the filename of the watermark and it will add your watermark on all the pages in the merged PDF file.

In summary, this PDF combiner tool is a must-have for anyone who needs to merge multiple PDF files into a single, large file. Its ability to combine as many files as you want and add watermarks make it a valuable tool for businesses, individuals, and anyone who works with PDF files regularly. So why not try it out for yourself and see how much time and hassle it can save you?
